

Background: African Swine Fever (ASF) is a devastating viral disease that affects pig populations and the farming economy. Currently, there is no approved vaccine for ASF. Its introduction and spread to the pig sector can be prevented by strict compliance with biosecurity measures. The quality of their implementation may depend upon the pig keepers' knowledge of ASF and acceptability of the control

Aim: To reveal Ukrainian swine smallholders' awareness of ASF clinical signs, possible modes of transmission, preventive measures. Additionally, we aimed to discover consequences for the swine smallholders of being in the restriction zone and their acceptance of ASF control measures.

## Materials & Methods:

Study design: Participatory epidemiology (PE) approach

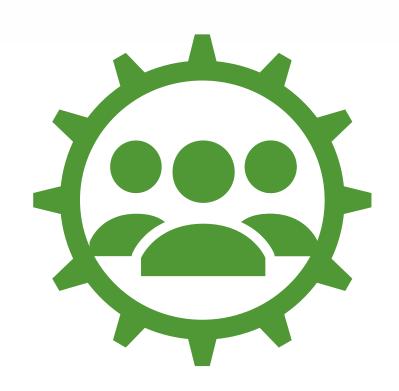

PE tools: Semi-structured interview, proportional piling, emoji face scale

Data collection: 10 focus group discussions

8 oblasts

52 swine smallholders (13 males, 39 females)

Data analysis: Semi-quantitative analysis

## Results:

measures.

ASF clinical signs ranked by the weighted sum of indicativeness:

1. Fever

2. Skin haemorrhages

3. Loss of appetite

**intitit** 

**Modes of ASF virus transmission to** the herd by the weighted sum of risk:

1. Rodents

2. Shoes

3. Transport vehicles

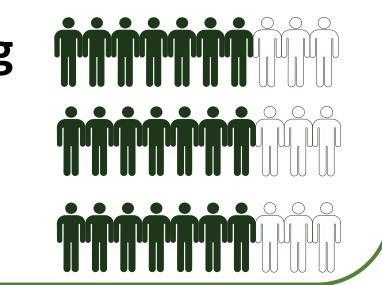

**TTTT** 

Preventive measures ranked by the weighted sum of effectiveness:

1. Disinfection of a pig holding

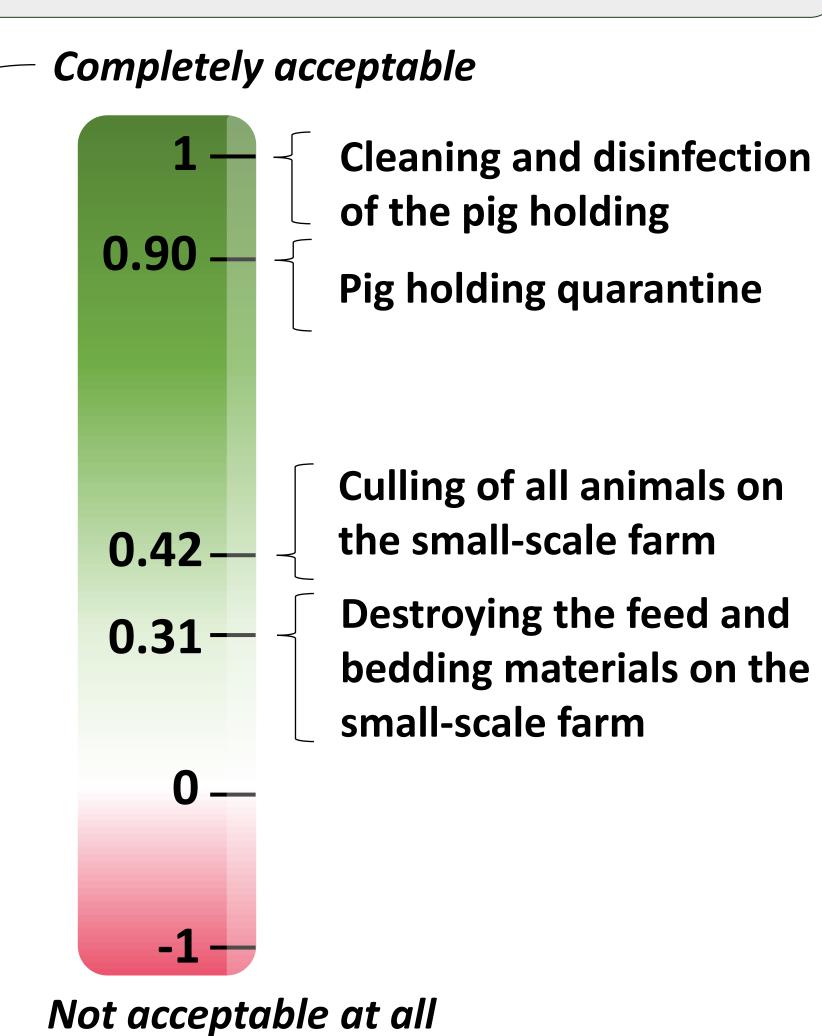

2. Access ban for people

3. Change of clothes, shoes

Acceptance of ASF eradication measures during an outbreak on a small-scale farm

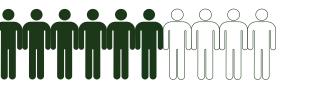

Consequences of being in the restriction zone ranked by the weighted sum of impact on swine smallholders:

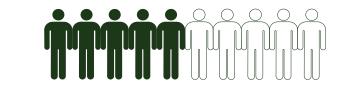

**Economical loss** 

2. Psychological stress

3. Enforced slaughter for own consumption

## Acceptance of measures in restriction zones

Completely acceptable **10** – **Restrictions on trade** with live pigs and 9 – porcine commodities 8.8 — **Restrictions on** moving animals **Restrictions on** moving materials

Not acceptable at all

## **Conclusions and Recommendations:**

- Swine smallholders in Ukraine are aware of ASF clinical features, modes of transmission, and preventive measures.
- Some ASF eradication measures should be explained thoroughly to livestock keepers to assure their better acceptance.
- Swine smallholders in Ukraine perceive ASF zoning measures in the restriction zones harmful for their farm economy and personal wellbeing.
